Chapter 1

Module Index

1.1 Modules

Here is a list of all modules:

mesh APIs	5
---------------------	---

Chapter 2

Data Structure Index

2.1 Data Structures

Here are the data structures with brief descriptions:

mesh_header_format	25
mesh_header_option_format	26
mesh_header_option_frag_format	27
mesh_header_option_header_type	27
mesh_scan_para_type	28
mesh_sub_node_info	28

Chapter 3

Module Documentation

3.1 mesh APIs

ESP8266_NONOS_SDK mesh APIs.

Data Structures

- struct [mesh_sub_node_info](#)
- struct [mesh_header_option_format](#)
- struct [mesh_header_option_header_type](#)
- struct [mesh_header_option_frag_format](#)
- struct [mesh_header_format](#)
- struct [mesh_scan_para_type](#)

Enumerations

- enum [mesh_op_result](#) { [MESH_ONLINE_SUC](#) = 0, [MESH_LOCAL_SUC](#) = 1, [MESH_DISABLE_SUC](#) = 2, [MESH_OP_FAILURE](#) = -1 }
- enum [mesh_type](#) { [MESH_CLOSE](#) = 0, [MESH_LOCAL](#), [MESH_ONLINE](#), [MESH_NONE](#) = 0xFF }
- enum [mesh_status](#) { [MESH_DISABLE](#) = 0, [MESH_WIFI_CONN](#), [MESH_NET_CONN](#), [MESH_LOCAL_AVAIL](#), [MESH_ONLINE_AVAIL](#) }
- enum [mesh_node_type](#) { [MESH_NODE_PARENT](#) = 0, [MESH_NODE_CHILD](#), [MESH_NODE_ALL](#) }
- enum [mesh_option_type](#) { [M_O_CONGEST_REQ](#) = 0, [M_O_CONGEST_RESP](#), [M_O_ROUTER_SPREAD](#), [M_O_ROUTE_ADD](#), [M_O_ROUTE_DEL](#), [M_O_TOPO_REQ](#), [M_O_TOPO_RESP](#), [M_O_MCAST_GRP](#), [M_O_MESH_FRAG](#), [M_O_USR_FRAG](#), [M_O_USR_OPTION](#) }
- enum [mesh_usr_proto_type](#) { [M_PROTO_NONE](#) = 0, [M_PROTO_HTTP](#), [M_PROTO_JSON](#), [M_PROTO_MQTT](#), [M_PROTO_BIN](#) }
- enum [mesh_pkt_direct](#) { [MESH_ROUTE_DOWNLOADS](#) = 0, [MESH_ROUTE_UPWARDS](#) }
- enum [espnow_dbg_data_type](#) { [M_FREQ_CAL](#) = 0, [WIFI_STATUS](#), [FREE_HEAP_SIZE](#), [CHILD_NUM](#), [SUB_DEV_NUM](#), [MESH_STATUS](#), [MESH_VERSION](#), [MESH_ROUTER](#), [MESH_LAYER](#), [MESH_ASSOC](#), [MESH_CHANNEL](#) }

Functions

- void * [espconn_mesh_create_packet](#) (uint8_t *dst_addr, uint8_t *src_addr, bool p2p, bool piggyback_cr, enum [mesh_usr_proto_type](#) proto, uint16_t data_len, bool option, uint16_t ot_len, bool frag, enum [mesh_option_type](#) frag_type, bool mf, uint16_t frag_idx, uint16_t frag_id)
The function is used to create mesh packet.
- void * [espconn_mesh_create_option](#) (uint8_t otype, uint8_t *ovalue, uint8_t val_len)
The function is used to create mesh option..
- bool [espconn_mesh_add_option](#) (struct [mesh_header_format](#) *head, struct [mesh_header_option_format](#) *option)
The function is used to add mesh option in mesh packet.
- bool [espconn_mesh_get_option](#) (struct [mesh_header_format](#) *head, enum [mesh_option_type](#) otype, uint16_t oidx, struct [mesh_header_option_format](#) **option)
The function is used to get mesh option in mesh packet..
- bool [espconn_mesh_get_usr_data](#) (struct [mesh_header_format](#) *head, uint8_t **usr_data, uint16_t *data_len)
The function is used to get user data in mesh packet..
- bool [espconn_mesh_set_usr_data](#) (struct [mesh_header_format](#) *head, uint8_t *usr_data, uint16_t data_len)
The function is used to set user data in mesh packet..
- bool [espconn_mesh_get_src_addr](#) (struct [mesh_header_format](#) *head, uint8_t **src_addr)
The function is used to get source address of mesh packet.
- bool [espconn_mesh_get_dst_addr](#) (struct [mesh_header_format](#) *head, uint8_t **dst_addr)
The function is used to get destination address of mesh packet.
- bool [espconn_mesh_set_src_addr](#) (struct [mesh_header_format](#) *head, uint8_t *src_addr)
The function is used to set source address of mesh packet.
- bool [espconn_mesh_set_dst_addr](#) (struct [mesh_header_format](#) *head, uint8_t *dst_addr)
The function is used to set destination address of mesh packet.
- bool [espconn_mesh_get_usr_data_proto](#) (struct [mesh_header_format](#) *head, enum [mesh_usr_proto_type](#) *proto)
The function is used to get protocol used by user data in mesh packet.
- bool [espconn_mesh_set_usr_data_proto](#) (struct [mesh_header_format](#) *head, enum [mesh_usr_proto_type](#) proto)
The function is used to set protocol used by user data in mesh packet.
- bool [espconn_mesh_local_addr](#) (struct ip_addr *ip)
Check whether the IP address is mesh local IP address or not.
- bool [espconn_mesh_is_root](#) ()
Check whether current node is root or not.
- bool [espconn_mesh_get_node_info](#) (enum [mesh_node_type](#) type, uint8_t **info, uint16_t *count)
The function is used to get the information of mesh node..
- bool [espconn_mesh_get_router](#) (struct station_config *router)
The function is used to get router AP information used by mesh node.
- bool [espconn_mesh_set_router](#) (struct station_config *router)
The function is used to set router AP information for mesh node.
- bool [espconn_mesh_encrypt_init](#) (AUTH_MODE mode, uint8_t *passwd, uint8_t pw_len)
The function is used to init encrypt algorithm and password for mesh AP.
- bool [espconn_mesh_group_id_init](#) (uint8_t *grp_id, uint16_t gid_len)
The function is used to init group id for mesh node.
- bool [espconn_mesh_regist_conn_ready_cb](#) (espconn_mesh_usr_callback cb)
The function is used to register user callback. If TCP connection with parent node is ready, mesh will call the user callback..
- bool [espconn_mesh_regist_usr_cb](#) (espconn_mesh_usr_callback cb)

The function is used to register user callback. If child node joins parent, parent will trigger the callback to indicate user.

- bool `espconn_mesh_server_init` (struct ip_addr *ip, uint16_t port)

The function is used to set server ip and port for mesh node.

- bool `espconn_mesh_set_max_hops` (uint8_t max_hops)

The function is used to set max_hops for mesh network..

- bool `espconn_mesh_set_ssid_prefix` (uint8_t *prefix, uint8_t prefix_len)

The function is used to set SSID prefix for mesh AP.

- bool `espconn_mesh_set_scan_retries` (uint8_t retries)

The function is used to set scan retries if no available AP to been found.

- int8_t `espconn_mesh_connect` (struct espconn *usr_esp)

Try to establish mesh connection to server.

- int8_t `espconn_mesh_disconnect` (struct espconn *usr_esp)

Disconnect a mesh connection.

- int8_t `espconn_mesh_get_status` ()

The function is used to get current status of mesh node.

- int8_t `espconn_mesh_send` (struct espconn *usr_esp, uint8_t *pdata, uint16_t len)

Send data through mesh network.

- uint8_t `espconn_mesh_get_max_hops` ()

The function is used to get current max hop of mesh network.

- uint8_t `espconn_mesh_layer` (struct ip_addr *ip)

The function is used to get current max hop of mesh network.

- uint16_t `espconn_mesh_get_sub_dev_count` ()

The function is used to get the number of all the sub nodes of current node.

- void `espconn_mesh_enable` (espconn_mesh_callback enable_cb, enum mesh_type type)

To enable mesh network.

- void `espconn_mesh_disable` (espconn_mesh_callback disable_cb)

To disable mesh network.

- void `espconn_mesh_deauth_all` ()

The function is used to reject all the child node.

- void `espconn_mesh_disp_route_table` ()

The function is used to display route table of current node.

- void `espconn_mesh_print_ver` ()

The function is used to print version of mesh.

- void `espconn_mesh_release_congest` ()

The function is used to discard all the packet to parent.

- void `espconn_mesh_scan` (struct mesh_scan_para_type *para)

The function is used to scan AP around current node.

- void `espconn_mesh_setup_timer` (os_timer_t *timer, uint32_t time, os_timer_func_t cb, void *arg, bool repeat)

The function is used setup timer with callback function.

Variables

- struct `mesh_sub_node_info` `__packed`

3.1.1 Detailed Description

ESP8266_NONOS_SDK mesh APIs.

3.1.2 Enumeration Type Documentation

3.1.2.1 enum espnow_dbg_data_type

Enumerator

M_FREQ_CAL int16_t
WIFI_STATUS uint8_t
FREE_HEAP_SIZE uint16_t
CHILD_NUM uint8_t
SUB_DEV_NUM uint16_t
MESH_STATUS int8_t
MESH_VERSION string with '\0'
MESH_ROUTER struct station_config
MESH_LAYER uint8_t
MESH_ASSOC uint8_t
MESH_CHANNEL uint8_t

3.1.2.2 enum mesh_node_type

Enumerator

MESH_NODE_PARENT get information of parent node
MESH_NODE_CHILD get information of child node(s)
MESH_NODE_ALL get information of all nodes

3.1.2.3 enum mesh_op_result

Enumerator

MESH_ONLINE_SUC enable online mesh success
MESH_LOCAL_SUC enable local mesh success
MESH_DISABLE_SUC disable mesh success
MESH_OP_FAILURE mesh operation fail

3.1.2.4 enum mesh_option_type

Enumerator

M_O_CONGEST_REQ congest request option
M_O_CONGEST_RESP congest response option
M_O_ROUTER_SPREAD router information spread option
M_O_ROUTE_ADD route table update (node joins mesh) option
M_O_ROUTE_DEL route table update (node exits mesh) option
M_O_TOPO_REQ topology request option
M_O_TOPO_RESP topology response option
M_O_MCAST_GRP group list of mcast
M_O_MESH_FRAG mesh management fragment option
M_O_USR_FRAG user data fragment
M_O_USR_OPTION user option

3.1.2.5 enum mesh_status

Enumerator

MESH_DISABLE mesh disabled
MESH_WIFI_CONN WiFi connected
MESH_NET_CONN TCP connection OK
MESH_LOCAL_AVAIL local mesh is available
MESH_ONLINE_AVAIL online mesh is available

3.1.2.6 enum mesh_usr_proto_type

Enumerator

M_PROTO_NONE used to delivery mesh management packet
M_PROTO_HTTP user data formatted with HTTP protocol
M_PROTO_JSON user data formatted with JSON protocol
M_PROTO_MQTT user data formatted with MQTT protocol
M_PROTO_BIN user data is binary stream

3.1.3 Function Documentation

3.1.3.1 bool espconn_mesh_add_option (struct mesh_header_format * head, struct mesh_header_option_format * option)

The function is used to add mesh option in mesh packet.

Parameters

<i>struct</i>	mesh_header_format *head : mesh packet header
<i>struct</i>	mesh_header_option_format *option : option

Returns

true : success
false : fail

3.1.3.2 int8_t espconn_mesh_connect (struct espconn * usr_esp)

Try to establish mesh connection to server.

Attention

1. If espconn_mesh_connect fail, returns non-0 value, there is no connection, so it won't enter any espconn callback.

Parameters

<i>struct</i>	espconn *usr_esp : the network connection structure, the usr_esp to listen to the connection
---------------	--

Returns

0 : succeed

Non-0 : error code

- ESPCONN_RTE - Routing Problem
- ESPCONN_MEM - Out of memory
- ESPCONN_ISCONN - Already connected
- ESPCONN_ARG - Illegal argument, can't find the corresponding connection according to structure espconn

3.1.3.3 void* espconn_mesh_create_option (uint8_t otype, uint8_t* ovalue, uint8_t val_len)

The function is used to create mesh option..

Parameters

<i>uint8_t</i>	otype : option type
<i>uint8_t</i>	*ovalue : option value
<i>uint8_t</i>	val_len : length of option value

Returns

NULL: create mesh option fail.

addr: the start address of option.

3.1.3.4 void* espconn_mesh_create_packet (uint8_t* dst_addr, uint8_t* src_addr, bool p2p, bool piggyback_cr, enum mesh_usr_proto_type proto, uint16_t data_len, bool option, uint16_t ot_len, bool frag, enum mesh_option_type frag_type, bool mf, uint16_t frag_idx, uint16_t frag_id)

The function is used to create mesh packet.

Attention

1. If the destination of packet is server or mobile, the dst_addr is the combination of IP address and port of server or mobile.
2. If the destination of packet is node, the dst_addr is the mac address of destination device.
3. If mobile or server try to sent packet to device, mobile or server needs to fill the src_addr with combination of its IP address and port. Mobile or server can fill src_addr with default value which is zero.
4. If the packet is produced by device, device need to fill src_addr with its mac address.
5. Device and mobile should set the piggyback_cr.

Parameters

<i>uint8_t</i>	*dst_addr : destination address (6 Bytes)
<i>uint8_t</i>	*src_addr : source address (6 Bytes)
<i>bool</i>	p2p : node-to-node packet
<i>bool</i>	piggyback_cr : piggyback flow request
<i>enum</i>	mesh_usr_proto_type proto : protocol used by user data
<i>uint16_t</i>	data_len : length of user data
<i>bool</i>	option : option flag

<i>uint16_t</i>	ot_len : option total length
<i>bool</i>	frag : fragmentation flag
<i>enum</i>	mesh_option_type frag_type : fragmentation type
<i>bool</i>	mf : more fragmentation
<i>uint16_t</i>	frag_idx : fragmentation index
<i>uint16_t</i>	frag_id : fragmentation id

Returns

NULL: create mesh packet fail.
 addr: the start address of mesh packet.

3.1.3.5 void espconn_mesh_deauth_all ()

The function is used to reject all the child node.

Parameters

<i>null</i>	
-------------	--

Returns

null

3.1.3.6 void espconn_mesh_disable (espconn_mesh_callback disable_cb)

To disable mesh network.

Attention

When mesh network is disabled, the system will trigger disable_cb.

Parameters

<i>espconn_↔ mesh_callback</i>	disable_cb : callback function of mesh-disable
------------------------------------	--

Returns

null

3.1.3.7 int8_t espconn_mesh_disconnect (struct espconn * usr_esp)

Disconnect a mesh connection.

Attention

Do not call this API in any espconn callback. If needed, please use system task to trigger espconn_mesh_↔ disconnect.

Parameters

<i>struct</i>	espconn *usr_esp : the network connection structure
---------------	---

Returns

- 0 : succeed
- Non-0 : error code
 - ESPCONN_ARG - illegal argument, can't find the corresponding TCP connection according to structure espconn

3.1.3.8 void espconn_mesh_disp_route_table ()

The function is used to display route table of current node.

Parameters

<i>null.</i>	
--------------	--

Returns

null.

3.1.3.9 void espconn_mesh_enable (espconn_mesh_callback enable_cb, enum mesh_type type)

To enable mesh network.

Attention

1. the function should be called in user_init.
2. Therefore, after enable mesh, user should wait for the enable_cb to be triggered.

Parameters

<i>espconn ↔ mesh_callback</i>	enable_cb : callback function of mesh-enable
<i>enum</i>	mesh_type type : type of mesh, local or online.

Returns

null

3.1.3.10 bool espconn_mesh_encrypt_init (AUTH_MODE mode, uint8_t * passwd, uint8_t pw_len)

The function is used to init encrypt algorithm and password for mesh AP.

Attention

1. The API should be called before enable mesh..

Parameters

<i>AUTH_MODE</i>	mode : encrypt algorithm (WPA_PSK, WPA2_PSK, WPA_WPA2_PSK)
<i>uint8_t</i>	*passwd : password
<i>uint8_t</i>	pw_len : length of password

Returns

true : success
false : fail

3.1.3.11 bool espconn_mesh_get_dst_addr (struct mesh_header_format * head, uint8_t ** dst_addr)

The function is used to get destination address of mesh packet.

Parameters

<i>struct</i>	mesh_header_format *head : mesh packet header
<i>uint8_t</i>	**dst_addr : destination address

Returns

true : success
false : fail

3.1.3.12 uint8_t espconn_mesh_get_max_hops ()

The function is used to get current max hop of mesh network.

Parameters

<i>null.</i>	
--------------	--

Returns

the current max hop of mesh

3.1.3.13 bool espconn_mesh_get_node_info (enum mesh_node_type type, uint8_t ** info, uint16_t * count)

The function is used to get the information of mesh node..

Attention

1. Before enable mesh, you must not use the API.
2. If type is MESH_NODE_PARENT, count is the number of parent (always 1), info is the mac address of paren.
3. If type is MESH_NODE_CHILD, count is the number of children whose hop away from current node is one. Info is the collection of sub node information

Parameters

<i>enum</i>	mesh_node_type type : mesh node type
<i>uint8_t</i>	**info : the information will be saved in *info

<i>uint16_t</i>	*count : the node count in *inf
-----------------	---------------------------------

Returns

true : success
false : fail

3.1.3.14 `bool espconn_mesh_get_option (struct mesh_header_format * head, enum mesh_option_type otype, uint16_t oidx, struct mesh_header_option_format ** option)`

The function is used to get mesh option in mesh packet..

Parameters

<i>struct</i>	mesh_header_format *head : mesh packet header
<i>enum</i>	mesh_option_type otype : option type
<i>uint16_t</i>	oidx : option index
<i>struct</i>	mesh_header_option_format **option : option

Returns

true : success, option is pointered to the destination option
false : fail

3.1.3.15 `bool espconn_mesh_get_router (struct station_config * router)`

The function is used to get router AP information used by mesh node.

Attention

1. The API should be called after user receives the first user packet from parent.
2. User should provide the router buffer to save router AP information

Parameters

<i>struct</i>	station_config *router : if success, the router AP information will be saved in router
---------------	--

Returns

true : success
false : fail

3.1.3.16 `bool espconn_mesh_get_src_addr (struct mesh_header_format * head, uint8_t ** src_addr)`

The function is used to get source address of mesh packet.

Parameters

<i>struct</i>	mesh_header_format *head : mesh packet header
<i>uint8_t</i>	**src_addr : source address

Returns

true : success
false : fail

3.1.3.17 `int8_t espconn_mesh_get_status ()`

The function is used to get current status of mesh node.

Attention

1. The API should be called after enable mesh.

Parameters

<i>null</i>	
-------------	--

Returns

MESH_DISABLE: mesh is disabled.

MESH_WIFI_CONN: node is trying to connect parent WIFI AP.

MESH_NET_CONN: node has got its IP address and tries to establish TCP connect with parent.

MESH_ONLINE_AVAIL: online mesh is available.

MESH_ONLINE_AVAIL: online mesh is available.

MESH_LOCAL_AVAIL: local mesh is available.

3.1.3.18 `uint16_t espconn_mesh_get_sub_dev_count ()`

The function is used to get the number of all the sub nodes of current node.

Parameters

<i>null.</i>	
--------------	--

Returns

the number of sub nodes

3.1.3.19 `bool espconn_mesh_get_usr_data (struct mesh_header_format * head, uint8_t ** usr_data, uint16_t * data_len)`

The function is used to get user data in mesh packet..

Parameters

<i>struct</i>	mesh_header_format *head : mesh packet header
<i>uint8_t</i>	**usr_data : user data
<i>uint16_t</i>	*data_len : length of user data

Returns

true : success

false : fail

3.1.3.20 `bool espconn_mesh_get_usr_data_proto (struct mesh_header_format * head, enum mesh_usr_proto_type * proto)`

The function is used to get protocol used by user data in mesh packet.

Parameters

<i>struct</i>	mesh_header_format *head : mesh packet header
<i>enum</i>	mesh_usr_proto_type *proto : protocol of user data

Returns

true : success
false : fail

3.1.3.21 bool espconn_mesh_group_id_init (uint8_t * grp_id, uint16_t gid_len)

The function is used to init group id for mesh node.

Attention

1. The API should be called before enable mesh.
2. The current group id length must be 6.

Parameters

<i>uint8_t</i>	*grp_id : group id
<i>uint16_t</i>	gid_len : length of group id

Returns

true : success
false : fail

3.1.3.22 bool espconn_mesh_is_root ()

Check whether current node is root or not.

Parameters

<i>null</i>	
-------------	--

Returns

true : root node
false : non-root or node which doesn't join mesh

3.1.3.23 uint8_t espconn_mesh_layer (struct ip_addr * ip)

The function is used to get current max hop of mesh network.

Attention

1. If ip is not local IP address, the layer will be one..
2. ip should not be NULL. If the ip is NULL, the layer will be one.

Parameters

<i>struct</i>	<i>ip_addr *ip</i> : IP address
---------------	---------------------------------

Returns

hop away from router

3.1.3.24 `bool espconn_mesh_local_addr (struct ip_addr * ip)`

Check whether the IP address is mesh local IP address or not.

Attention

1. The range of mesh local IP address is 2.255.255.* ~ max_hop.255.255.*.
2. IP pointer should not be NULL. If the IP pointer is NULL, it will return false.

Parameters

<i>struct</i>	<i>ip_addr *ip</i> : IP address
---------------	---------------------------------

Returns

true : the IP address is mesh local IP address
false : the IP address is not mesh local IP address

3.1.3.25 `void espconn_mesh_print_ver ()`

The function is used to print version of mesh.

Parameters

<i>null.</i>	
--------------	--

Returns

null.

3.1.3.26 `bool espconn_mesh_regist_conn_ready_cb (espconn_mesh_usr_callback cb)`

The function is used to register user callback. If TCP connection with parent node is ready, mesh will call the user callback..

Parameters

<i>espconn_↔ mesh_usr_↔ callback</i>	<i>cb</i> : user callback function
--	------------------------------------

Returns

true : success
false : fail

3.1.3.27 `bool espconn_mesh_regist_usr_cb (espconn_mesh_usr_callback cb)`

The function is used to register user callback. If child node joins parent, parent will trigger the callback to indicate user.

`/**`

Parameters

<i>espconn_↔ mesh_usr_↔ callback</i>	cb : user callback function
--	-----------------------------

Returns

true : success
false : fail

3.1.3.28 void espconn_mesh_release_congest ()

The function is used to discard all the packet to parent.

Parameters

<i>null.</i>	
--------------	--

Returns

null.

3.1.3.29 void espconn_mesh_scan (struct mesh_scan_para_type * para)

The function is used to scan AP around current node.

Attention

1. user can scan all the AP or mesh node AP.
2. If you plan to scan all the AP, please clear grp_id and grp_set in para.
3. If you just plan to scan mesh node AP, you should set grp_id and grp_set in para.

Parameters

<i>struct</i>	mesh_scan_para_type *para : parameter of scan
---------------	---

Returns

null.

3.1.3.30 int8_t espconn_mesh_sent (struct espconn * usr_esp, uint8 * pdata, uint16 len)

Send data through mesh network.

Attention

Please call espconn_mesh_sent after espconn_sent_callback of the pre-packet.

Parameters

<i>struct</i>	espconn *usr_esp : the network connection structure
---------------	---

<i>uint8</i>	*pdata : pointer of data
<i>uint16</i>	len : data length

Returns

0 : succeed

Non-0 : error code

- ESPCONN_MEM - out of memory
- ESPCONN_ARG - illegal argument, can't find the corresponding network transmission according to structure espconn
- ESPCONN_MAXNUM - buffer of sending data is full
- ESPCONN_IF - send UDP data fail

3.1.3.31 `bool espconn_mesh_server_init (struct ip_addr * ip, uint16_t port)`

The function is used to set server ip and port for mesh node.

Attention

1. The API should be called before enable mesh.

Parameters

<i>struct</i>	ip_addr *ip : IP address
<i>uint16_t</i>	port : port

Returns

true : success

false : fail

3.1.3.32 `bool espconn_mesh_set_dst_addr (struct mesh_header_format * head, uint8_t * dst_addr)`

The function is used to set destination address of mesh packet.

Parameters

<i>struct</i>	mesh_header_format *head : mesh packet header
<i>uint8_t</i>	*dst_addr : destination address

Returns

true : success

false : fail

3.1.3.33 `bool espconn_mesh_set_max_hops (uint8_t max_hops)`

The function is used to set max_hops for mesh network..

Attention

1. The API should be called before enable mesh.

Parameters

<i>uint8_t</i>	max_hops : max hops of mesh network
----------------	-------------------------------------

Returns

true : success
false : fail

3.1.3.34 bool espconn_mesh_set_router (struct station_config * router)

The function is used to set router AP information for mesh node.

Attention

1. The API should be called before enable mesh..

Parameters

<i>struct</i>	station_config *router : router AP information (ssid, password, bssid (optional))
---------------	---

Returns

true : success
false : fail

3.1.3.35 bool espconn_mesh_set_scan_retries (uint8_t retries)

The function is used to set scan retries if no available AP to been found.

Attention

1. If no available AP mesh node, the scan retries will works.
2. If retries should be larger than zero (zero will be failed).
3. One scan will take about 15 * retries seconds at most. If retries is 2, the scan will take 30 seconds at most.

Parameters

<i>uint8_t</i>	retries : scan retry count
----------------	----------------------------

Returns

true : success
false : fail

3.1.3.36 bool espconn_mesh_set_src_addr (struct mesh_header_format * head, uint8_t * src_addr)

The function is used to set source address of mesh packet.

Parameters

<i>struct</i>	mesh_header_format *head : mesh packet header
---------------	---

<i>uint8_t</i>	*src_addr : source address
----------------	----------------------------

Returns

true : success
false : fail

3.1.3.37 bool espconn_mesh_set_ssid_prefix (uint8_t * prefix, uint8_t prefix_len)

The function is used to set SSID prefix for mesh AP.

Attention

1. The API should be called before enable mesh.

Parameters

<i>uint8_t</i>	*prefix : prefix of SSID
<i>uint8_t</i>	prefix_len : length of prefix

Returns

true : success
false : fail

3.1.3.38 bool espconn_mesh_set_usr_data (struct mesh_header_format * head, uint8_t * usr_data, uint16_t data_len)

The function is used to set user data in mesh packet..

Parameters

<i>struct</i>	mesh_header_format *head : mesh packet header
<i>uint8_t</i>	*usr_data : user data
<i>uint16_t</i>	data_len : length of user data

Returns

true : success
false : fail

3.1.3.39 bool espconn_mesh_set_usr_data_proto (struct mesh_header_format * head, enum mesh_usr_proto_type proto)

The function is used to set protocol used by user data in mesh packet.

Parameters

<i>struct</i>	mesh_header_format *head : mesh packet header
<i>enum</i>	mesh_usr_proto_type proto : protocol of user data

Returns

true : success
false : fail

3.1.3.40 void espconn_mesh_setup_timer (os_timer_t * timer, uint32_t time, os_timer_func_t cb, void * arg, bool repeat)

The function is used setup timer with callback function.

Parameters

<i>os_timer_t</i>	*timer : timer
<i>uint32_t</i>	time: timeout time
<i>os_timer_func_t</i>	cb : callback function
<i>void</i>	*arg : argment
<i>bool</i>	repeat: repeat flag

Returns

null.
